Initial angle θ
Difference between the configuration calculated $T(\theta^{(i)})$ with the forward kinematics and the target configuration, called error ($\vec{e}^{(i)}$).
$\vec{e}^{(i)} = J((\theta)^{(i)})\Delta\theta^{(i)}$
Update joint angle values
$\theta = \theta + J^{-1}((\theta)^{(i)})\vec{e}^{(i)}.$
$\|T(\theta^{(i)})\| < \varepsilon$
Calculate joint angle changes
$\vec{e}^{(i)} = J((\theta)^{(i)})\Delta\theta^{(i)}$
Terminate algorithm,
